STATISTICS FOR DATA SCIENCE

Chi-squared Test

Tender for collecting toll for a newly opened bridge

Day	Monday	Tuesday	Wednesday	Thursday	Friday	Saturday	Sunday
No	170	20	90	130	200	170	220

Day	Monday	Tuesday	Wednesday	Thursday	Friday	Saturday	Sunday
No	190	50	100	130	200	150	200

For example:

- A gambler wants to test a die to see whether it deviates from fairness.

- Let p_i be the probability that the number i comes up. The null hypothesis will state that the die is fair.

- The null hypothesis is $H_0 : p_1 = p_{01}, p_2 = p_{02}, \ldots p_6 = p_{06} = 1/6.$

STATISTICS FOR DATA SCIENCE

Chi-squared Test

- A generalization of the Bernoulli trial is the multinomial trial
- Which is an experiment that can result in any one of k outcomes, where $k \geq 2$.
- The probabilities of the k outcomes are denoted $p_1, \ldots, p_k$.
- In this section, we generalize the tests for a Bernoulli probability to multinomial trials.
- The null hypothesis has the form

$$H_0 : p_1 = p_{01}, p_2 = p_{02}, \ldots p_k = p_{0k}.$$

STATISTICS FOR DATA SCIENCE

Chi-squared Test

- The gambler rolls the die 600 times and The results obtained are called the observed values.
- To test the null hypothesis, we construct a second column, labeled “Expected.” This column contains the expected values.
- The expected value for a given outcome is the mean number of trials that would result in that outcome if H_0 were true.

STATISTICS FOR DATA SCIENCE

Chi-squared Test

- The idea behind the hypothesis test is that if H_0 is true, then the observed and expected values are likely to be close to each other.

- Therefore we will construct a test statistic that measures the closeness of the observed to the expected values.

STATISTICS FOR DATA SCIENCE

Chi-squared Test

- The statistic is called the chi-square statistic. To define it, let k be the number of outcomes ($k = 6$ in the die example),
- Let O_i and E_i be the observed and expected numbers of trials, respectively, that result in outcome i .
- The chi-square statistic is

$$\chi 2 = \sum_{i=1}^{k} \frac{(O_i - E_i)^2}{E_i}$$

STATISTICS FOR DATA SCIENCE

Chi-squared Test

- When the expected values are all sufficiently large, a good approximation is available.
- It is called the chi-square distribution with $k - 1$ degrees of freedom, denoted $\chi 2_{k-1}$
- A table for the chi-square distribution is available

STATISTICS FOR DATA SCIENCE

Chi-squared Test

Example:

The gambler rolls the die 600 times and The results obtained are as shown in the table:

STATISTICS FOR DATA SCIENCE

Chi-squared Test

Example:

Consider the following table

Catogory	Observed	Expected
1	115	100
2	97	100
3	91	100
4	101	100
5	110	100
6	86	100
Tot	600	600

STATISTICS FOR DATA SCIENCE

Chi-squared Test

$$\chi^2 = \frac{(115-100)^2}{100} + \cdots \frac{(86-100)^2}{100}$$

$$= \frac{100}{2.25 + \cdots + 1.96}$$

$$= 6.12$$

The upper 10% point is 9.236. We conclude that $P > 0.10$. There is no evidence to suggest that the die is not fair.
