## Scheduling Algorithms

---

**Venkatesh Prasad**

Department of Computer Science

- The slides/diagrams in this course are an **adaptation**, **combination**, and **enhancement** of material from the following resources and persons:
  1. Slides of Operating System Concepts, Abraham Silberschatz, Peter Baer Galvin, Greg Gagne - 9<sup>th</sup> edition 2013 and some slides from 10<sup>th</sup> edition 2018
  2. Some conceptual text and diagram from Operating Systems - Internals and Design Principles, William Stallings, 9<sup>th</sup> edition 2018
  3. Some presentation transcripts from A. Frank – P. Weisberg
  4. Some conceptual text from Operating Systems: Three Easy Pieces, Remzi Arpaci-Dusseau, Andrea Arpaci Dusseau

## Multi-level Queue & Feedback Queue Scheduling

**Venkatesh Prasad**

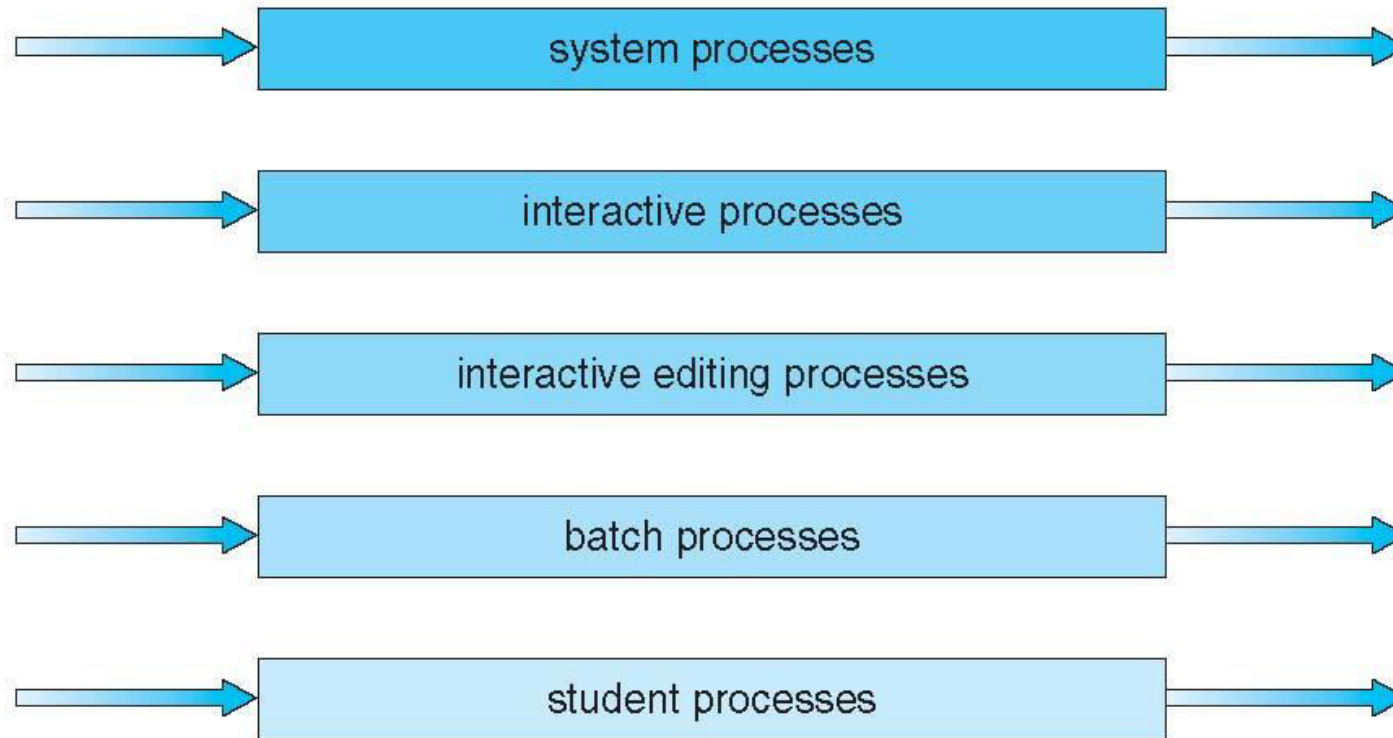

Department of Computer Science

- Ready queue is partitioned into separate queues, eg:
  - **foreground** (interactive)
  - **background** (batch)
- Process permanently in a given queue
- Each queue has its own scheduling algorithm:
  - foreground – RR
  - background – FCFS
- Scheduling must be done between the queues:
  - Fixed priority scheduling; (i.e., serve all from foreground then from background). Possibility of starvation.
  - Time slice – each queue gets a certain amount of CPU time which it can schedule amongst its processes; i.e., 80% to foreground in RR, 20% to background in FCFS

# OPERATING SYSTEMS

## Multilevel Queue Scheduling

highest priority

lowest priority

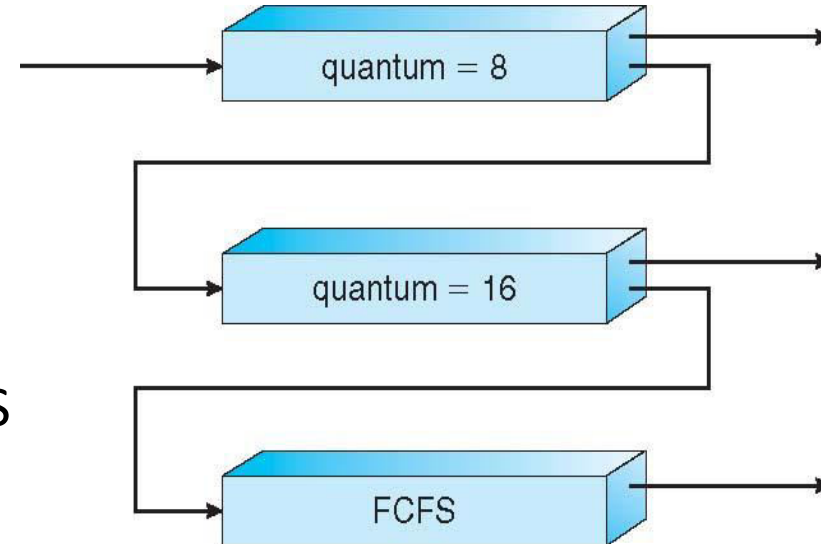

- A process can move between the various queues; aging can be implemented this way
- Multilevel-feedback-queue scheduler defined by the following parameters:
  - number of queues
  - scheduling algorithms for each queue
  - method used to determine when to upgrade a process
  - method used to determine when to demote a process
  - method used to determine which queue a process will enter when that process needs service

### ■ Three queues:

- $Q_0$  – RR with time quantum 8 milliseconds
- $Q_1$  – RR time quantum 16 milliseconds
- $Q_2$  – FCFS

### ■ Scheduling

- A new job enters queue  $Q_0$  which is served FCFS
  - ▶ When it gains CPU, job receives 8 milliseconds
  - ▶ If it does not finish in 8 milliseconds, job is moved to queue  $Q_1$
- At  $Q_1$  job is again served FCFS and receives 16 additional milliseconds
  - ▶ If it still does not complete, it is preempted and moved to queue  $Q_2$

**THANK YOU**
