5	$S \rightarrow aAa \mid bBb \mid BB, A \rightarrow C, B \rightarrow S \mid A, C \rightarrow S \mid \lambda$	8
6	$E \rightarrow E+T \mid T, T \rightarrow T * F \mid F, F \rightarrow \text{num} \mid \text{id}$	9

## Chomsky Normal Form

### 1. Introduction

A context free grammar is in chomsky normal form (CNF) if all the productions rules satisfy one of the following condition

- 1) A non - terminal generating terminal  
Ex:  $X \rightarrow x$
- 2) A non - terminal generating two non terminals  
Ex:  $X \rightarrow XY$
- 3) Start symbol generating  $\lambda$   
Ex:  $S \rightarrow \lambda$

### 2. Why Chomsky Normal Form

The key advantage of CF is, every derivation of a string of  $n$  letters have exactly  $2n-1$  steps. Thus one can determine the string is in the language by exhaustive search of all derivations. Normal forms make many concepts much easier to handle because you can assume a simple structure for them. CNF enables a polynomial time algorithm to decide whether a string can be generated by the grammar.

If every production in the grammar is in the form  $X \rightarrow x$  and  $X \rightarrow XY$  then we say that the grammar is in CNF. CNF makes the parse tree a binary tree, in a binary tree, a node may have either one or two child nodes. In a parse tree obtained from the CNF grammar,

- 1) If a node has one child, that child is a terminal symbol  
Ex:  $A \rightarrow a$
- 2) If a node has two children that, that child are non terminal symbol

### 3. Converting Context Free Grammar (CFG) to Chomsky Normal Form(CNF)

To convert the CFG to CNF the CFG should be clean, that is it must not have any

- 1) Lambda production  
Ex:  $A \rightarrow \lambda$   
The variables that have such productions are nullable variables
- 2) Unit Productions  
(It just replaces one variable with another variable without any progress in the derivation)
- 3) Useless variables:  
These are of two types
  - a) Non-generating variables:

This will never lead to terminal symbols. If a non generating variable is introduced into the sentential form, it is a dead end, the sentential form can never generate any string in the language

- b) Productions for unreachable variables

These variables does not appear on the right hand side of any production

### 3.1 Steps to Convert CFG to CNF

Follow the steps in the given order

#### **Step 1: Eliminate lambda productions:**

Step 1: Find out all nullable variables.

Step 2: In the RHS of every production where the nullable variables exists

- a) Write the production rule with and without the nullable variable
- b) Eliminate nullable variable production

Step 2 might produce useless productions and unit productions

Note : we will not eliminate all the  $\lambda$  productions for the grammar

If  $\lambda \in L(G)$

In this case we set  $S \rightarrow \lambda$

#### **Step 2: Eliminate Unit production**

Why?

If we have

$A \rightarrow B$

$B \rightarrow C$

$C \rightarrow d$

In order to generate d,

We should follow the derivation

Step 1:  $A \rightarrow B$

Step 2:  $B \rightarrow C$

Step 3:  $C \rightarrow d$

Length of their sentential forms is not increasing neither the number of terminals.

Note: Every step in the derivation has to be useful either increasing the sentential form or increasing the number of terminals.

So the above step 1, 2 and 3 are useless.

#### **Step 3: Eliminating Useless productions and Symbols**

There are two aspects to begin a useful symbol

- 1) Derivability

If a variable A is useful it must generate orderive string of terminals

$A \Rightarrow w$  (w is a string of terminals)

## 2) Reachability

Every useful variable must be reachable from S

$S \rightarrow A \Rightarrow w$

That is,

A useful variable must be reachable from S and must deriva a string of terminals

### Note:

For a given language there are many  $G_1, G_2, \dots, G_n$  multiple grammars, some are more elegant than others leading to better parsers and faster compilers.

-> we can convert a grammar eo Normal Form that gives us cleaner grammars with good algorithms for parsing

-> Most wel, known Normal Forms for CG's is CNF. or energy CFG there is an equivalent CNF

Here,

Each production in the grammar either generates a terminal or expands a sentential form by exactly 1

$A \rightarrow a$

$A \rightarrow BC$

-> If every production in the grammar is in this form we say G is in CNF

-> CNF makes the parse tree as binary tree

-> Algorithm for converting CFG to CNF is based on the idea of substitution

### 4. Example:

**Convert the following CFG to CNF**

1)  $S \rightarrow aX \mid Yb$

$X \rightarrow S \mid \lambda$

$Y \rightarrow bY \mid b$

Step 1: Eliminate  $\lambda$  productions

$S \rightarrow aX \mid a \mid Yb$

$X \rightarrow S$

$Y \rightarrow bY \mid b$

Step 2: Eliminate Unit Productions

$S \rightarrow aX \mid a \mid Yb$

$X \rightarrow aX \mid a \mid Yb$

$Y \rightarrow bY \mid b$

Step 3: There are no useless productions

Step 4: Conversion to CNF:

$S \rightarrow AX \mid YB \mid a$

$X \rightarrow AX \mid YB \mid a$

$Y \rightarrow BY \mid b$

$A \rightarrow a$

$B \rightarrow b$

2)  $S \rightarrow aSa \mid bSb \mid A \mid \lambda$

$A \rightarrow a \mid b \mid \lambda$

Solution:

Step 1: Remove  $\lambda$  production

$S \rightarrow aSa \mid aa \mid bSb \mid bb \mid A$

$A \rightarrow a \mid b$

Step 2: Remove unit production ( $S \rightarrow A$ )

$S \rightarrow aSa \mid aa \mid bSb \mid bb \mid a \mid b$

$A \rightarrow a \mid b$

Step 3: Remove useless production(A)

$S \rightarrow aSa \mid aa \mid bSb \mid bb \mid a \mid b$

Now the CFG is

$A \rightarrow a$

$B \rightarrow b$

$S \rightarrow ASA \mid BSB \mid AA \mid BB \mid a \mid b$

Step 4: To CNF

$A \rightarrow a$

$B \rightarrow b$

$C \rightarrow AS$

$D \rightarrow BS$

$S \rightarrow CA \mid DB \mid AA \mid Bb \mid a \mid b$

$$3) S \rightarrow BAB$$

$$B \rightarrow bba$$

$$A \rightarrow Bc$$

Solution:

Step 1: There are no  $\lambda$  production

Step 2 There are no unit productions

Step 3: There are no useless production

Step 4: To CNF

$$C \rightarrow a$$

$$D \rightarrow b$$

$$E \rightarrow c$$

$$F \rightarrow BA$$

$$G \rightarrow DD$$

$$S \rightarrow FB$$

$$B \rightarrow GC$$

$$A \rightarrow BE$$

$$4) S \rightarrow Aa \mid B \mid Ca$$

$$B \rightarrow aB \mid b$$

$$C \rightarrow Db \mid D$$

$$D \rightarrow E \mid d$$

$$E \rightarrow ab$$

Solution:

Step 1: There are no  $\lambda$  production

Step 2: Remove unit production

$$S \rightarrow Aa \mid aB \mid b \mid Ca$$

$$B \rightarrow aB \mid b$$

$$C \rightarrow Db \mid ab \mid d$$

$$D \rightarrow ab \mid d$$

$$E \rightarrow ab$$

Step 3: Remove useless production

E is useless production and Aa is useless as there is no variable A

Step 4: To CNF

$X \rightarrow a$

$Y \rightarrow b$

$S \rightarrow XB \mid b \mid CX$

$B \rightarrow XB \mid b$

$C \rightarrow DY \mid XY \mid d$

$D \rightarrow XY \mid d$

5)  $S \rightarrow aAa \mid bBb \mid BB$

$A \rightarrow C$

$B \rightarrow S \mid A$

$C \rightarrow S \mid \lambda$

Solution:

Step 1: Remove  $\lambda$  production

$S \rightarrow aAa \mid aa \mid bBb \mid bb \mid BB$

$A \rightarrow C$

$B \rightarrow S \mid A$

$C \rightarrow S$

Step 2: Remove unit productions

$S \rightarrow aAa \mid aa \mid bBb \mid bb \mid BB$

$A \rightarrow aAa \mid aa \mid bBb \mid bb \mid BB$

$B \rightarrow aAa \mid aa \mid bBb \mid bb \mid BB$

$C \rightarrow aAa \mid aa \mid bBb \mid bb \mid BB$

Step 3: Remove useless production

C is useless production

$S \rightarrow aAa \mid aa \mid bBb \mid bb \mid BB$

$A \rightarrow aAa \mid aa \mid bBb \mid bb \mid BB$

$B \rightarrow aAa \mid aa \mid bBb \mid bb \mid BB$

Step 4: To CNF

$X \rightarrow a$

$Y \rightarrow b$

$P \rightarrow XA$

$Q \rightarrow YB$

$S \rightarrow PX \mid XX \mid QY \mid YY \mid BB$

$A \rightarrow PX \mid XX \mid QY \mid YY \mid BB$

$$B \rightarrow PX \mid XX \mid QY \mid YY \mid BB$$

$$\begin{aligned} 6) \quad E &\rightarrow E + T \mid T \\ T &\rightarrow T * F \mid F \\ F &\rightarrow \text{num} \mid \text{id} \end{aligned}$$

Solution:

Step 1: There are no  $\lambda$  production

Step 2: Remove unit production ( $E \rightarrow T$ ) and ( $T \rightarrow F$ )

$$\begin{aligned} E &\rightarrow E + T \mid T * F \mid F \\ T &\rightarrow T * F \mid \text{num} \mid \text{id} \\ F &\rightarrow \text{num} \mid \text{id} \end{aligned}$$

This results in  $E \rightarrow F$ , remove this

$$\begin{aligned} E &\rightarrow E + T \mid T * F \mid \text{num} \mid \text{id} \\ T &\rightarrow T * F \mid \text{num} \mid \text{id} \\ F &\rightarrow \text{num} \mid \text{id} \end{aligned}$$

Step 3: There are no use less productions

Now the CFG is:

$$\begin{aligned} A &\rightarrow + \\ B &\rightarrow * \\ E &\rightarrow EAT \mid TBF \mid \text{num} \mid \text{id} \\ T &\rightarrow TBT \mid \text{num} \mid \text{id} \\ F &\rightarrow \text{num} \mid \text{id} \end{aligned}$$

Step 4 : To CFG

$$\begin{aligned} A &\rightarrow + \\ B &\rightarrow * \\ C &\rightarrow EA \\ D &\rightarrow TB \\ E &\rightarrow CT \mid DF \mid \text{num} \mid \text{id} \\ T &\rightarrow DT \mid \text{num} \mid \text{id} \\ F &\rightarrow \text{num} \mid \text{id} \end{aligned}$$
