PES UNIVERSITY**

**(Established under Karnataka Act No.16 of 2013)  
100-ft Ring Road, BSK III Stage, Bangalore - 560 085**

## Table of contents

Section	Topic	Page number
1	Context Free Grammar (Non-Linear)	3

### Examples Solved:

#	Construct a Context Free Grammar	Page number
1	Construct a CFG for $L=\{uvwv^R,  u = w =2,  v >1, w \in \{a,b\}^*\}$	3
2	Construct a CFG for $L=\{n_a(w)=n_b(w), w \in \{a,b\}^*\}$	4
3	Construct a CFG for $L=\{n_a(w)=n_b(w)+1, w \in \{a,b\}^*\}$	5
4	Construct a CFG for $L=\{n_a(w) = 2 \times n_b(w), w \in \{a,b\}^*\}$ .	5
5	Construct a CFG for $L=\{n_a(w) > n_b(w), w \in \{a,b\}^*\}$ .	5
6	Construct a CFG for $L=\{n_a(w) \neq n_b(w), w \in \{a,b\}^*\}$ .	6
7	Construct a CFG for $L=\{a^n b^n \cup a^n b^{2n}\}$ .	6
8	Construct /a CFG for Language of proper nesting(parenthesis matching).	7
9	Construct a CFG for Language of proper nesting(parenthesis matching).	7
10	Construct a CFG for Language to generate arithmetic expressions.	8
11	Construct a CFG for nested if else.	8
12	Construct a CFG to take care of variable declarations in C Language.	9
13	Construct a CFG to generate nested while loops.	9

## 1. Context Free Grammar (Non-Linear)

CFG may have more than one variable/non-terminal on the right-hand side of the production.

LHS can only be a single variable/non-terminal.

### Example 1:

Construct a CFG for  $L = \{uvwv^R, |u|=|w|=2, |v|>1, w \in \{a,b\}^*\}$

**A** will take care of **u** and **B** will take care of **v w v<sup>R</sup>**.

$|u|=|w|=2$

$|v|>1$ ,  $vv^R$ -palindrome.

**S** → **A B**

**A** → **aa|bb|ab|bb** ( $|u|=2$ )

**B** → **aBa|bBb** (to generate palindrome- $vv^R$ )

**B** → **aBa|bBb|A** (**B** → **A**, since  $|w|=|u|=2$ )

The CFG for  $L = \{uvwv^R, |u|=|w|=2, |v|>1, w \in \{a,b\}^*\}$  is :

**S** → **A B**

**A** → **aa|bb|ab|bb**

**B** → **aBa|bBb|A**

### Example 2:

Construct a CFG for  $L = \{n_a(w) = n_b(w), w \in \{a,b\}^*\}$

Note that  $n_a(w) = n_b(w)$  is not the same as  $a^n b^n$ .

$a^n b^n \subseteq n_a(w) = n_b(w)$

In  $n_a(w) = n_b(w)$  there is no specific order.

$S \rightarrow aSb | bSa | \lambda$

From the above production rule we cannot generate “abba” which also has an equal number of a’s and b’s.

$S \Rightarrow aSb \Rightarrow abSab \Rightarrow abab$ , we cannot generate “abba”.

Parse tree for deriving “abba”

ab ,ab must occur side by side, to do that we introduce the production  $S \rightarrow SS$

$S \rightarrow aSb | bSa | \lambda | SS$

$S \Rightarrow SS \Rightarrow aSbS \Rightarrow aSbaSb \Rightarrow abab$

Parse Tree for deriving “abab:

The CFG for  $L = \{n_a(w) = n_b(w), w \in \{a,b\}^*\}$  is :

$S \rightarrow aSb | bSa | \lambda | SS$

**Example 3:**

Construct a CFG for  $L = \{n_a(w) = n_b(w) + 1, w \in \{a, b\}^*\}$

The grammar is similar to  $n_a(w) = n_b(w)$ , here for  $n_a(w) = n_b(w) + 1$  we terminate with a, instead of terminating with  $\lambda$ .

The CFG for  $L = \{n_a(w) = n_b(w) + 1, w \in \{a, b\}^*\}$  is :

$S \rightarrow aSb|bSa|a|SS$

**Example 4:**

Construct a CFG for  $L = \{n_a(w) = 2 \times n_b(w), w \in \{a, b\}^*\}$ .

$n_a(w) = 2 \times n_b(w)$ , the number of a's = twice the number of b's.

Minimal strings =  $\lambda, aab, baa, aba$  (there is no order)

Since there is no order, we can put an S between aab, baa, abb

$S \rightarrow aSaSb|bSaSa|aSbSb|SS|\lambda$  ( $S \rightarrow SS$  will take care of any order)

The CFG for  $L = \{n_a(w) = 2 \times n_b(w), w \in \{a, b\}^*\}$  is:

$S \rightarrow aSaSb|bSaSa|aSbSb|SS|\lambda$

**Example 5:**

Construct a CFG for  $L = \{n_a(w) > n_b(w), w \in \{a, b\}^*\}$ .

The number of a's is more than the number of b's.

We can produce,

1. an equal number of a's and b's .
2. only a's .
3. terminate with a.

$S \rightarrow aSb|bSa$  (an equal number of a's and b's )

$S \rightarrow aS|Sa$  (only a's)

$S \rightarrow a$

$S \rightarrow SS$  (a's and b's in any order)

The CFG for  $L = \{n_a(w) > n_b(w), w \in \{a, b\}^*\}$  is:

$S \rightarrow aSb|bSa|SS|aA|a$

**Example 6:**

Construct a CFG for  $L = \{n_a(w) \neq n_b(w), w \in \{a,b\}^*\}$ .

$n_a(w) \neq n_b(w)$ , number of a's are more or number of b's are more.

$S \rightarrow A|B$

**A** will take care of the number **of a's** more than the number of b's.

**B** will take care of the number **of b's** more than the number of a's.

$S \rightarrow A|B$

$A \rightarrow aAb|bAa$  (equal number of a's and b's)

$A \rightarrow AA$  (takes care of a's and b's in any order.)

$A \rightarrow aA|Aa|a$  (more a's)

Similarly for B,

$B \rightarrow aBb|bBa|BB|bB|Bb|b$  (more b's)

The CFG for  $L = \{n_a(w) \neq n_b(w), w \in \{a,b\}^*\}$  is:

$S \rightarrow A|B$

$A \rightarrow aAb|bAa|AA|aA|Aa|a$

$B \rightarrow aBb|bBa|BB|bB|Bb|b$

**Example 7:**

Construct a CFG for  $L = \{a^n b^n \cup a^n b^{2n}\}$ .

Generate the grammar for  $a^n b^n$  and  $a^n b^{2n}$ .

So the Grammar  $L = \{a^n b^n \cup a^n b^{2n}\}$ , must generate string in  $a^n b^n$  and the strings in  $a^n b^{2n}$  or both. Union is an "or" operator.

$L = \{a^n b^n \cup a^n b^{2n}\}$

$S \rightarrow S_1 \mid S_2$

$S_1 \rightarrow aS_1b \mid \lambda$

$S_2 \rightarrow aS_2bb \mid \lambda$

### Example 8:

Construct a CFG for Language of proper nesting(parenthesis matching).

Let  $\Sigma = \{ (, ) \}$  and let  $L = \{ w \in \Sigma^* \mid w \text{ is a string of balanced parentheses} \}$ .

The string must start with an opening parenthesis.

At any point, counting from left to right (i.e., in any prefix), the number of closing parentheses encountered thus far cannot be greater than the number of opening parentheses. The number of opening and closing parentheses must be equal at the end of the string.

Look at the closing parenthesis that matches the first open parenthesis.

$((()())())$

$S \rightarrow (S) \mid SS$

The empty string( $\lambda$ ) is a string of balanced parentheses.

$S \rightarrow \lambda$

### Parse tree:

CFG for Language of proper nesting:

$S \rightarrow (S) \mid SS$

$S \rightarrow \lambda$

### Example 9:

Construct a CFG for Language of proper nesting(parenthesis matching).

Let  $\Sigma = \{ (, \{, [ , ], \} , ) \}$  and let  $L = \{ w \in \Sigma^* \mid w \text{ is a string of balanced parentheses} \}$ .

Example of matched parenthesis:  $[ \{ ( ( \{ \} ) ) \} ]$

This is similar to the previous example.

CFG for Language of proper nesting for  $\Sigma = \{ (, \{, [ , ], \} , ) \}$  is:

$S \rightarrow (S) \mid \{S\} \mid [S] \mid SS \mid \lambda$

**Example 10:**

Construct a CFG for Language to generate arithmetic expressions.

$\Sigma = \{+, -, *, /, (), \text{number } [0-9], \text{id}\}$   
 id-identifiers/variable names .

Inplace of S we will use E as the start symbol.

$E \rightarrow E + E \mid E - E \mid E * E \mid E / E \mid (E) \mid \text{id} \mid \text{number}$

**Parse tree for a+4-c:**

CFG for Language to generate arithmetic expressions is:

$E \rightarrow E + E \mid E - E \mid E * E \mid E / E \mid (E) \mid \text{id} \mid \text{number}$

**Example 11:**

Construct a CFG for nested if else.

$\Sigma = \{\text{if, condition, then, else, statement, \{, \} \}$

- $\{, \}$  avoids dangling else problems .It associates else with corresponding if.
- An example string in the language is as follows:  
 If condition then statement else { if condition then statement else statement }

$S \rightarrow \text{if condition then } S$

$S \rightarrow \text{if condition then } S \text{ else } S$

$S \rightarrow \{\text{statement}\}$  (braces to avoid the dangling else problem )

CFG for nested if else is:

$S \rightarrow \text{if condition then } S$

$S \rightarrow \text{if condition then } S \text{ else } S$

$S \rightarrow \{\text{statement}\}$

**Example 12:**

Construct a CFG to take care of variable declarations in C Language.

Declarations :

Example : int a, int a,b .Here every declaration is in the format type followed by variables also called as id's separated by comma.

$D \rightarrow \text{Type List}$  (List -list of variables)

$\text{List} \rightarrow \text{List, id} \mid \text{id}$  (List  $\rightarrow$  List, id list ending with id)

$\text{Type} \rightarrow \text{int} \mid \text{float} \mid \text{char}$

Parse Tree for declaration int a,b

**Example 13:**

Construct a CFG to generate nested while loops.

While has a condition, while(condition)

$S \rightarrow \text{while}(\text{condition})S \mid \{\text{statement}\}$

**Do while loop:**

$S \rightarrow \text{while}(\text{condition})S \mid \text{do } S \text{ while } (\text{condition})\{\text{statement}\}$
