Introduction to the Design and Analysis of Algorithms Author: Anany Levitin 2nd Edition

Recurrence

Recurrence is an equation or inequality that describes a function in terms of its value on smaller inputs

Recurrences can take many forms

Example:

- T(n)=T(n/2)+1
- T(n)=T(n-1)+1
- T(n)=T(2n/3)+T(n/3)+1

Important Recurrence Types

Decrease-by-one recurrences

A decrease-by-one algorithm solves a problem by exploiting a relationship between a given instance of size n and a smaller size n-1.

Example: n!

The recurrence equation has the form

$$T(n) = T(n-1) + f(n)$$

> Decrease-by-a-constant-factor recurrences

A decrease-by-a-constant algorithm solves a problem by dividing its given instance of size n into several smaller instances of size n/b, solving each of them recursively, and then, if necessary, combining the solutions to the smaller instances into a solution to the given instance.

Example: binary search.

The recurrence has the form

$$T(n) = aT(n/b) + f(n)$$

Methods to solve recurrences

- Substitution Method
 - Mathematical Induction

- Backward substitution
- Recursion Tree Method
- ➤ Master Method (Decrease by constant factor recurrences)

Example1:

$$T(n) = T(n-1) + 1$$
 $n>0$ $T(0) = 1$
 $T(n) = T(n-1) + 1$
 $= T(n-2) + 1 + 1 = T(n-2) + 2$
 $= T(n-3) + 1 + 2 = T(n-3) + 3$
...
 $= T(n-i) + i$
...
 $= T(n-n) + n = n=O(n)$

Example2:

$$T(n) = T(n-1) + 2n - 1 \qquad T(0) = 0$$

$$= [T(n-2) + 2(n-1) - 1] + 2n - 1$$

$$= T(n-2) + 2(n-1) + 2n - 2$$

$$= [T(n-3) + 2(n-2) - 1] + 2(n-1) + 2n - 2$$

$$= T(n-3) + 2(n-2) + 2(n-1) + 2n - 3$$
...
$$= T(n-i) + 2(n-i+1) + ... + 2n - i$$
...
$$= T(n-n) + 2(n-n+1) + ... + 2n - n$$

$$= 0 + 2 + 4 + ... + 2n - n$$

$$= 2 + 4 + ... + 2n - n$$

$$= 2 + 4 + ... + 2n - n$$

$$= 2 + n * (n+1)/2 - n$$
// arithmetic progression formula $1 + ... + n = n(n+1)/2 / m = 0(n^2)$

Example 3:

$$T(n) = T(n/2) + 1 n > 1$$

$$T(1) = 1$$

$$T(n) = T(n/2) + 1$$

$$= T(n/2^{2}) + 1 + 1$$

$$= T(n/2^{3}) + 1 + 1 + 1$$
.....
$$= T(n/2^{i}) + i$$
.....
$$= T(n/2^{k}) + k (k = \log n)$$

$$= 1 + \log n$$

$$= O(\log n)$$

Example 4:

$$T(n) = 2T(n/2) + cn n > 1 T(1) = c$$

$$T(n) = 2T(n/2) + cn$$

$$= 2(2T(n/2^{2}) + c(n/2)) + cn = 2^{2}T(n/2^{2}) + cn + cn$$

$$= 2^{2}(2T(n/2^{3}) + c(n/2^{2})) + cn + cn = 2^{3}T(n/2^{3}) + 3cn$$
.....
$$= 2^{i}T(n/2^{i}) + icn$$
.....
$$= 2^{k}T(n/2^{k}) + kcn (k = \log n)$$

$$= nT(1) + cn \log n = cn + cn \log n$$

$$= O(n \log n)$$
