## **Large-Sample Tests for a Population Mean**

- Let  $X_1, X_2, \ldots, X_n$  be a *large* (e.g., n > 30) sample from a population with mean  $\mu$  and standard deviation  $\sigma$ .
- To test a null hypothesis of the form
- $H_0: \mu \leq \mu_0, H_0: \mu \geq \mu_0$ , or  $H_0: \mu = \mu_0$ :

## **Large-Sample Tests for a Population Mean**

• Compute the z-score:

$$z = \frac{\overline{X} - \mu 0}{\sigma / \sqrt{n}}$$

If  $\sigma$  is unknown it may be approximated with s.

**Large-Sample Tests for a Population Mean** 

- Compute the P-value.
- The *P*-value is an area under the normal curve, which depends on the alternate hypothesis as in the table:

# **Large-Sample Tests for a Population Mean**

Alternate Hypothesis	P-value
$H_1: \mu > \mu_0$	Area to the right of z
$H_1: \mu < \mu_0$	Area to the left of z
$H_1: \mu = \mu_0$	Sum of the areas in the tails cut off by $z$ and $-z$

**Large-Sample Tests for a Population Mean** 

## **Example:**

- The mean lifetime of a sample of 100 fluorescent light bulbs produced by a company is computed to be 1570 hours with a standard deviation of 120 hours.
- If  $\mu$  is the life time of all the bulbs produced by the company test the hypothesis  $\mu=1600\ hours$  against the alternate hypothesis  $\mu\neq1600\ hours$ .

### **Large-Sample Tests for a Population Mean**

#### **Solution:**

$$H_0$$
:  $\mu = 1600$  hours

$$H_{\underline{1}}$$
:  $\mu \neq 1600$  hours  $\overline{X} = 1570$ ,  $\sigma = s = 120$ ,  $n = 100$ 

$$z = \frac{X - \mu 0}{\sigma / \sqrt{n}} = \frac{1570 - 1600}{120 / \sqrt{100}} = -2.51$$

P- Value is 0.012.

Which is very low . So we reject  $\boldsymbol{H}_0$ 

## **Large-Sample Tests for a Population Mean**

## **Example:**

- A trucking firm is suspicious of the claim that the average lifetime of certain tires is at least 28,000 miles.
- To check the claim, the firm puts 40 of these tires on its trucks and gets a mean lifetime of 27,463 with a standard deviation 1,348 miles.

Find the P value for testing  $H_0$ :  $\mu \ge 28,000 \ miles H_1$ :  $\mu < 28,000 \ miles$ ?

## **Large-Sample Tests for a Population Mean**

#### **Solution:**

$$H_0$$
:  $\mu \ge 28,000$  miles

$$H_1$$
:  $\mu$  < 28,000 miles

$$z = \frac{\overline{X} - \mu}{s/\sqrt{n}} = \frac{27,463 - 28,000}{1,348/\sqrt{40}} = -2.52 < -2.33$$

**P – Value is 0.0059** 

Since P- Value is a very small probability we need to reject  $H_0$
